Roll #3, Frame #15, Date: 2000/07/31

Site #723, Upstream photo of the stream flowing through a rootwad  
Roll #3, Frame #16, Date: 2000/07/31

## **APPENDIX II**

### **Phase Completion Reports**

Phase I-III Completion Report  
Phase IV Completion Report  
Phase V-VI Completion Report

**Phase I to III Pre-field Project Planning Report - 1:20 000 Fish and Fish Habitat Inventory  
of the Sub-basins between and including Lorne and Mill Creeks on the North Side of the  
Skeena River within the Kispiox Forest District**

- **FRBC Project Number:** SCI\_C172\_010\_2001
- **FDIS Project Code:** 3476
- **Project Name:** Reconnaissance (1:20,000 scale) Fish and Fish Habitat of the Sub-basins between and including Lorne and Mill Creeks on the North Side of the Skeena River within the Kispiox Forest District.
- **FRBC Activity Number:** 712318
- **FRBC Region:** Skeena-Bulkley Region
- **MELP Region:** Skeena Region 6
- **Forest District:** Kispiox Forest District
- **Project Type:** 1:20 000 Reconnaissance
- **Report Date:** June 30, 2000
- **Proponent:** Skeena Cellulose Inc. (Carnaby Operations)
- **Company/Agency:** Triton Environmental Consultants Ltd.
- **Contact Person:** Jason Harris
- **Contact Phone:** (250) 635-1494
- **Contact E-mail:** jharris@triton-env.com
- **MELP Project Monitor:** Paul Giroux
- **FRBC Coordinator:** Todd Mahon
- **Proponent QA Monitor:**

### Summary of Work Completed

A meeting was conducted with Todd Mahon (contract monitor) to obtain information regarding the project specifications and project area.

A background data review was conducted to establish existing information within the working area. These reports were obtained from the Ministry of Environment Land and Parks (MELP) office in Smithers, the SCL office in Carnaby and the BC Conservation Data Centre. A bibliography and contact list was completed (attached).

FISS maps were reviewed and compared with the data collected during the background review. Information that was not included on the FISS maps, as well as new information gathered in Phase 4, will be transcribed to a corresponding 1:50,000 scale National Topographic Scale (NTS) map at Phase 5.

The project area boundaries were delineated on TRIM maps and all streams, wetlands and lakes were assigned, waterbody identifiers or ILP's. Watershed codes and ILP's were assigned using Arcview and FDIS. Detailed map and air photo analysis was conducted in order to identify and classify sub-basins within the study area, to determine reach breaks and to determine individual reach characteristics for all watercourses, lakes and wetlands. The delineation of sub-basins was based on stream order and hierachy within the watershed.

All watercourses within the study area were divided into reaches and physical features affecting fish habitat suitability (including gradient, confinement, channel pattern and riparian vegetation) were identified.

- Planning for the field sampling portion of this project followed a balanced approach between MELP requirements and SCI's operational needs. Initial sample site selection was undertaken utilizing the FDIS random generator. Further discretionary sites were added to the initial randomly generated sampling sites.

Revisions to the stream sampling plan (alternate site locations) will be revised during Phase 4, which is scheduled to commence on July 24, 2000.

### **Progress and Problems Summary**

Due to the steep morphology of the study area, it is anticipated that barriers to fish may exist low in each watershed, close to the mainstem Skeena River. If this is the case, sample sites, most of which are placed randomly high in the watershed, will be completed in non-fish bearing streams. This is necessary to a point, however, completing order x 3 and 4 sample sites upstream of a barrier is not necessary and a waste of valuable helicopter and crew time. We anticipate several changes to the sampling plan, and as discussed with Paul Giroux and SCI these changes will significantly alter the original sample site selection. Detailed reach planning forms will be completed during Phase 5 and will be submitted as a deliverable for this phase.

No lakes were selected for sampling. Due to the steep nature of the terrain, lakes are not common throughout the study area. The existing lakes are either located in the alpine or in the lower valleys within fish bearing sections of the watersheds. It is anticipated that lake surveys would not play a large roll in determining fish presence throughout the study area.

### **Next Phase Project Plans and Constraints**

FISS updates will be provided with Phase V.

Phase IV (field) is scheduled to commence July 24, 2000

### **Summary of Phase 1-3 Costs**

|                   |             |
|-------------------|-------------|
| Professional Fees | \$24,056.00 |
| Disbursements     | \$1,084.00  |

Costs as per original budget

## PROJECT PHASE COMPLETION REPORT

### PHASE 4

- **MELP Project Number:** SCI\_C172\_010\_2001
- **Contract Name:** Reconnaissance (1:20 000 scale) Fish and Fish Habitat Inventory of Sub-basins between and including Lorne and Mill Creeks on the North Side of the Skeena River within the Kispiox Forest District
- **FRBC Activity Number:** 712318
- **FRBC Region:** Skeena-Bulkley Region
- **MELP Region:** Skeena 06
- **FDIS Project Code:** 3476
- **Forest District:** Kispiox Forest District
- **Project Type:** 1:20 000 Reconnaissance
- **Report Date:** October 2, 2000
- **Proponent:** Skeena Cellulose Inc. (Carnaby Operations)
- **Company/Agency:** Triton Environmental Consultants Ltd.
- **Contact Person:** Jason Harris
- **Contact Phone:** (250) 635-1494
- **Contact E-Mail:** jharris@triton-env.com
- **MELP Project Monitor:** Paul Giroux
- **FRBC Coordinator:** Todd Mahon
- **Proponent QA Monitor:** Chris Schell

#### List of Deliverables Submitted

| July 25, 2000 –<br>August 5, 2000 | Gear up, travel, field work and gear down for stream inventory in the Kispiox Forest District. | 490 hours         |

## Summary of Work Completed

Total number of stream reaches sampled: 118

## Summary of Phase Costs

|                   |             |
|-------------------|-------------|
| Professional Fees | \$19,049.00 |
| Disbursements     | \$20,070.00 |

## Progress and Problems Summary

Phase 4 was completed as scheduled. Sampling during late summer periods allowed crews to assess habitat during low flow conditions and gave a good representation of stream habitats throughout the year.

Helicopter time was used extensively to reference and locate several barriers downstream of selected inventory sites. Many of these additionally located barriers were confirmed as obstacles to upstream fish passage and changed the fish bearing status of several third order basins to non-fish bearing. Strategic sample selection by field crews maximized sampling efficiencies and further increased the non-fish bearing status of questionable streams.

Field crews were in constant contact with Paul Giroux (Fisheries Inventory Specialist) and Todd Mahon (FRBC contract monitor) when the originally proposed plan needed modifications. Modifications of the original plan were used to address barriers and provide additional fisheries information for the working area. In most cases sites downstream of known fish bearing reaches were moved to address barriers or provide additional sampling data to support non-fish bearing classifications.

## Next Phase Project Plans and Constraints

The project will now proceed with data compilation and reporting.

| Professional Fees | \$75,564.00 |
| Disbursements     | \$24,435.00 |

## **Progress and Problems Summary**

The reporting and mapping procedures followed those outlined in the *Reconnaissance (1:20,000) Inventory Standards* and includes additional data not otherwise required. The digitally produced maps include all information as per RIC standards and the contract. These maps include: watershed codes: ILP's: stream names: waterbody identifiers: stream networks: reach breaks: fish sampling/site card locations: fisheries sensitive zones: fish species: and features.

All data entered into FDIS was audited using MELP's QA/QC tool prior to inclusion into the watershed reports.

## **Next Phase Project Plans and Constraints**

Watershed codes were not received by project draft deliverable due date and therefore, conversions from ILP to watershed codes was not completed.

Nid to UTM conversions will be completed post QA/QC.

Digital mapping QA will be completed internally by Triton after QA/QC has been completed (as per Paul Giroux's (Regional Inventory Specialist) request).

## **Contract Monitor Acceptance**

Smithers, BC, V0J 2N0

Re: Quality Assurance of 1:20,000 Fish and Fish Habitat Inventory in the Kispiox Forest District completed by Triton Environmental Consultants Ltd.

Todd,

I have completed my second and final stage 3 quality assurance (QA) review of the aquatic inventory deliverables produced by Triton Environmental Consultants Ltd. With a few outstanding issues that I have discussed with Jason Harris, all of which will be dealt with in the final deliverables, all the concerns I identified during my first QA review have been addressed. **As a result, I'm pleased to grant final QA approval for this project.**

The original QA package and this letter will serve as the QA deliverables required for this phase, and should be forwarded to Paul Giroux with the final products. If you have any questions please contact me by e-mail (schell@bulkley.net) or by telephone (250-847-0180).

Sincerely,

Chris Schell, M.Sc. R.P.Bio

Todd:

The stage 1 quality assurance (QA) review of the 1:20k stream inventory program conducted by Triton Environmental Consultants Ltd. for SCI Carnaby has been completed. Resources Inventory Committee standard QA forms were filled-out during the audit and are included with this letter. These forms list objectives that were met and comments pertaining to any problems that were identified during the QA review.

Except for the maps, I received only digital deliverables. While these were sufficient for most of my QA purposes, hard copy reports and the overview map need to be submitted with the final deliverables. The background search for information was relatively complete, though it appears that no people were consulted for fisheries information for the area. The maps were reviewed for complete ILP coverage and also reach break analysis. Both were fine. ILP data tables were not submitted for QA and I would like to see them, digital file over e-mail would be fine.

The stream and lake checks found a few mistakes which require correction, but the error rate was well within allowable levels. The sampling plan was based on FDIS random samples plus a number of bias samples placed strategically to determine the upstream limits of fish distribution. The regional inventory specialist has allowed movement of randomly selected sites in the field if it becomes obvious that they are in non-fish bearing areas. This will likely result in significant changes to the final distribution of samples, but the result will be increased information per sample.

Overall, this project has no significant errors and has passed QA. I would only ask Triton to forward me a digital copy of the ILP tables for review. If you have any questions regarding the information presented in this memo or in the QA forms, please contact me by e-mail (schell@mail.bulkley.net) or by telephone (250-847-0180).

Sincerely,

Chris Schell

Comments:

**Recommended actions:**

Send me the ILP datasheets for review. Submit the missing hard copies and the overview map with the final deliverables. OK

\* If ILP maps and ILP data sheets have been sent to the ministry for processing, ILPs must be shown on the interim maps to allow QA to proceed.

**Approved:** Y**Comments:**

Reaches to be sampled did not have a reach form completed during phase 1-3. I will check reach cards of sampled reaches during phase 5-6 checks.

**Recommended actions:**

Correct all zero-tolerance errors. Conduct a search for other such errors.

**Approved:** Y**Comments:****Recommended actions :**1,2) If there are no inlets, magnitude should be 0, not left blank. Fixed -6) Why are the reach breaks ~100 m away from the lake? Fixed8) This lake is recorded as an ILP in FDIS and as a WBID on the map. The two must be consistent. Fixed9) There is no ILP label on the map for this lake, or the other ILP lake on this map for that matter. These these errors are "zero-tolerance" and required fixing. Fixed10) Lake is mis-labeled on the map. Magnitude is 12, not 10. Fixed

Todd:

The stage 2 quality assurance (QA) audits of the 1:20k stream inventory field data collection performed by Triton Environmental Consulting Ltd. has been completed. Resources Inventory Committee standard QA forms were completed during the audit and are included with this letter. These forms list objectives that were met and comments pertaining to any problems that were identified during the QA evaluation.

All crews passed the stage 2 QA audit with no comments. All demonstrated a proficient knowledge of how to collect and record data for the site card and fish collection form to full RIC standards. Fish collection effort and technique was also to standards and safety measures were maintained. I have audited the work of all the crewmembers in previous years and their positive response to my past comments has left me with nothing left to say this year.

This letter concludes the stage 2 QA audit and reporting. If you have any questions regarding the information presented in this letter or in the QA forms please contact me by e-mail (schell@bulkley.net) or by telephone (250-847-0180).

Sincerely,

Chris Schell

Todd Mahon, Wildfor Consultants  
FRBC Co-ordinator, Skeena Cellulose Ltd.  
Smithers, BC. V0J 2N0

Todd,

The stage 3 quality assurance (QA) review of the final deliverables for the 1:20k stream inventory sampling program performed by Triton Environmental Consulting Ltd. has been completed. Resources Inventory Committee standard QA forms were completed during the audit and are included with this letter. I also performed a stream classification QA, where I evaluated the resampling data supporting non-fish bearing stream recommendations. All forms list objectives that were met and comments pertaining to any problems that were identified during the QA evaluation.

Digital mapping files and printouts from the digital QA programs were missing from the deliverables. Once UTM's have been imported into FDIS, the FDIS and mapping QA programs must be run and the results printed up, marked-up with Triton's response to each error, then submitted to me for review. FISS maps and forms were to standards and the photodocumentation binder was complete though some negative number still need to be entered into FDIS. All negatives were entered into FDIS before QA submission, unfortunately FDIS does not accept alphanumeric numbering (FDIS programming error problem).

The card/FDIS/map check found almost no typological errors and no systematic problems. A check of the report found the results section is in a non-standard format. While much of the same information was present in different sections, some sections present in the RIC standards were missing from Triton's report (fish above 20% gradient). Of relevance to SCI was that the fish bearing status information was not all organized into the same section. While these are relatively minor complaints, I have discussed with Paul G. and we agreed that the point of the RIC standards is that anyone can open an RIC inventory report and know where to find certain information. Triton will be required to reorganize the report to the RIC format. There are some other report issues that are listed on the forms. Report has been rearranged to match Buba Creek with some cost plus/value added information (i.e. Stream Classification Table, Study Area Summary Table, Fish Capture Location Table...).

The maps for this project are a blend of the RIC project and interpretive map standards that Paul G. has approved. I reviewed the maps and found they contained all the information I find useful. The maps were generally to standards and complete. The interpretive colour coding mostly follows rules that Triton outlined in the report. I have marked up the maps where I feel

Triton should reconsider the coding, but these issues are a matter of judgement and not a strict QA concern.

I noted one re-occurring problem with Triton's non-fish bearing classifications. In many cases, sites on channels with wetted widths of 5 to 15m were sampled with electrofishing only. While this is acceptable for channels with wetted widths of a few meters, it not acceptable for larger channels. Small pole seines are useful in situations such as this and do not require revisiting the site. Pole seines are most effective in relatively small, shallow and slow moving systems with relatively few obstructions. Seining is also ineffective and difficult where water is > 1.5 m deep, stream velocities exceed about 0.8 m/s, banks are deeply undercut, and in areas with large amounts of small organic debris, tree root masses, and tree branches embedded in the stream substrate (FSIG pages 53-54). I also noted the electrofishing effort in these channels was minimal at best. One site I audited had a sample length less than 100m. Generally, effort (EF seconds) was far less than what I would have expected. For a channel with a wetted width over 10m I would expect ~1000 secs per 100m of channel.—Triton often did a 200-300m site with less than 500 secs of effort. If no fish are captured in the initial sample site, the biologist or field technician must make a professional judgement as to whether and how much further fish sampling should be conducted. Sampling is finished when the surveyor is confident that there is enough evidence to support the conclusion that no fish inhabit the reach (FSIG page 58). I have often captured my first Dolly Varden in a 10m wide alpine stream after 600 secs of EF effort. The effectiveness of electrofishing varies not only with environmental conditions and the species and size of fish, but also with the voltage, electric pulse frequency, and the experience of the electrofishing operator (FSIG page 55). Darren Fillier and Paul Giroux approved the NFBS for this project.

At Paul Giroux's request, the QA process will function somewhat differently this year. At this stage in the QA, I would ask Triton to review the forms, then communicate to me how they will address the concerns listed there. Once we have agreed how the issues are to be addressed, Triton can make the changes, submit the deliverables to me for a final QA check before I pass them on the Paul Giroux for a quick quality control check. The benefits of these changes are a more transparent QA process and a reduced wait for QC turnaround. If you have any questions regarding the information presented in this memo or in the QA forms please contact me by e-mail (schell@bulkley.net) or by telephone (250-847-0180).

Sincerely,

Chris Schell

**Note:** The map attributes table, introduced in 1999, replaces the point table and the attribute table from 1998 standards.

The FDIS and digital mapping files should be subjected to the digital QA tools (including proximity test on the mapping files). Print up the results of the tests and address all outstanding issues as required.

**Comments:**

- 1) Have you considered if this could qualify as a wetland or small lake? Yes
- 2) You forgot in FDIS to record that spawning habitat was fair. Not really
- 9) Typo in last two measurements. Not really

|                                                    | Table: Summary of fish bearing reaches...  | ✓                |         |

**Notes:**

2) Could be done for DV Optional  
 3) I remember a few unstable slopes on the cards that perhaps should be mentioned?  
 4) only if there are multiple histograms **for the same species** do they need the same X-axis. You should redo the histograms for CO, CH and CI so they are more useful.

**Attention: Paul Giroux**

Paul,

The following is a summary of how various issues were addressed after our meeting on January 23, 2001. Darren Fillier (Forest Ecosystem Specialist-Kispiox Forest District), Jason Harris (Triton-Terrace), Edward Lem (Triton-Smithers), and myself reviewed the Non Fish-Bearing Table and related mapping products for the Reconnaissance (1:20k) Fish and Fish Habitat Inventory of the Sub-Basins between and including Lorne and Mill Creeks on the North Side of the Skeena River.

All of the sites in the Non Fish-Bearing Table were evaluated and the maps were reviewed to ensure consistency. Two changes to the Non Fish-Bearing Table were requested:

- Site 3 (ILP 10301 Reach 3) was found to have inadequate supporting evidence to be classified as a non fish-bearing stream. Without fish sampling this reach must be changed from a confirmed non fish-bearing stream to inferred non fish-bearing stream until fish sampling confirms its status.
- Site 629 (ILP 11066 Reach 1) was found to contain poor terminology in the comments section. It was requested that wording such as 'no fish habitat' be changed to more descriptive wording to reduce the chance of differing interpretation.

At your request, Triton made the following changes to the Non Fish-Bearing Table, database and maps:

- Site 3 (ILP 10301 Reach 3) was changed to inferred non fish-bearing in the Non Fish Bearing Table. Reach 3 was changed on the map from solid blue to dashed blue. Reaches upstream of Site 3 were also changed to dashed blue to reflect the change in

classification. Changes were made to Site 3 in the database to make it consistent with the mapping product and the Non Fish-Bearing Table.

- Site 629 (ILP 11066 Reach 1) comments were changed to be more descriptive and poor terminology was removed.

Attached is the revised Non Fish-Bearing Table, which reflects the changes noted above. Could you please confirm that the changes made to the Non Fish-Bearing Table, database, and maps are acceptable and can be included in the final report deliverables.

Yours truly,

**Triton Environmental Consultants Ltd.**

Paul,

Once these changes are made can we move forward to generate the final reports and maps.

Jason: Thanks for the note and changes. A few other things to consider.

1. site 636 - term "no fish habitat used"....re-write to add more description as to why.
2. cascade dimensions: is it rise:run or opposite? this needs to be described as a foot note or in the caption.
3. You also need to describe what species you suspect to be present so as to assist in assessing potential barriers. For example, resident RB vs adult ST have very different barrier thresholds.
4. remember to use the phrase....no evidence of surface water flow when describing a discontinuity when it exists.

**Subject:** Re: QA report

Looks good to me. Because it's slightly different than what others have done I've sent it on to Paul for comment. But if he doesn't like it I'll argue with him since it's pretty much the same thing I usually get, just digital.

So from my point of view, it passes. I'll tell you what Paul thinks as soon as he tells me.

Just talked to Paul, it's fine by him.

Subject: QA report

Chris: Please find attached the exported FDIS QA for the SCI Inventory Project as per your request.

We have run the automated QA and fixed the problems identified. The attached table is the results of the second export. We have found the errors associated with this QA either false or unfixable. Please advise if the results of this QA are acceptable to you and if we can start producing the deliverables.

Jason Harris

**Attention: Paul Giroux**

Dear Sir:

**Re: Fish Inventory Submissions for the Reconnaissance 1:20,000 Fish and Fish Habitat Inventory of the Sub-basins between and including Lorne and Mill Creek on the North Side of the Skeena River within the Kispiox Forest District.**

Please find enclosed project deliverables for the Reconnaissance 1:20,000 Fish and Fish Habitat Inventory within Skeena Cellulose's Carnaby Operating Areas. As outlined in the General Services Agreement for FRBC Stream Inventories the following deliverables are enclosed:

**Report**

|                     |                                                              |
|---------------------|--------------------------------------------------------------|
| <b>Appendix I</b>   | Reach Cards/Site Cards/Fish Collection Forms and Photographs |
| <b>Appendix II</b>  | Phase Completion Reports                                     |
| <b>Appendix III</b> | Quality Assurance Forms and Correspondence                   |
| <b>Appendix IV</b>  | Phase I-III Project Plan (with attachments)                  |
| <b>Appendix V</b>   | Project/Interpretive Maps                                    |

**Attachment I** Planning Document  
Triton Environmental Consultants Ltd., July 2000. Phase I-III Pre-field Project Planning Report Reconnaissance (1:20,000) Fish and Fish Habitat Inventory of the Sub-basins between and including Lorne and Mill Creek on the North Side of the Skeena River within the Kispiox Forest District.

**Attachment II** Field Notes  
Site Cards/Fish Collection Forms

**Attachment III**      Photodocumentation  
                         Photo Summary Report  
                         Photo CD  
                         Prints in Plastic Sleeves  
                         Negatives in Plastic Sleeves

**Attachment IV**      Digital Data  
                         Watershed Report Files  
                         FDIS Files  
                         Mapping Files

**Attachment V**      FISS Update Data  
                         FISS Update Forms  
                         FISS Update Maps

As outlined in our contract, Triton requires confirmation of receipt in the form of a signed letter or e-mail from the recipient of the deliverables. Could you please e-mail or send me a letter to confirm that you have received the deliverables associated with this project (project checklist for deliverables is attached to this letter). Should you have any questions or require additional information, please contact me.

Yours truly,  
**Triton Environmental Consultants Ltd.**

Environmental Consultants Ltd.

## 1.0 INTRODUCTION

Triton Environmental Consultants Ltd. was retained by Skeena Cellulose Inc (Carnaby Operations) in partnership with Forest Renewal British Columbia (FRBC) and Ministry of Environment Lands and Parks (MELP) to conduct a 1:20,000 scale survey in sub-basins between and including Lorne and Mill Creek on the north side of the Skeena River. The rationale for conducting this project is based on the need to establish fish presence and distribution throughout the selected area, facilitate and/or confirm stream Riparian Management Area classifications and to combine all existing inventories completed within the watershed into one product. This project will be completed as per the requirements of the May 1998 Reconnaissance (1:20 000) Fish and Fish Habitat Inventory Standards for British Columbia. This report summarizes work completed in Phases I-III and outlines the project plan for Phases IV-VI.

### 1.1 Summary of Work Completed

A summary of work completed for each phase is outlined in the attached Phase completion Reports (Appendix I). This summary includes:

- contractor information;
- list of deliverables submitted;
- activity log;
- summary of work completed;
- summary of phase costs;
- progress and problems summary; and
- plans and constraints for phase 4-6.

## 2.0 STUDY AREA AND ACCESS

### 2.1 List of Trim Maps

The study area is approximately 8400 ha in size located along the northern edge of the Skeena River at the western edge of the Kispiox Forest District. The study area includes all tributaries to the Skeena River between Fiddler Creek (exclusive) to the southwest and Mill Creek (inclusive) to the northeast. The 1:20,000 TRIM sheets covering the study area include:

|          |          |          |          |
|----------|----------|----------|----------|
| 103I.087 | 103I.098 | 103P.009 | 103P.020 |
| 103I.088 | 103I.099 | 103P.010 | 103P.030 |
| 103I.089 | 103P.007 | 103P.018 |          |
| 103I.097 | 103P.008 | 103P.019 |          |

## **2.2 Sub-basins between and including Lorne and Mill Creek**

The sub-basins to be sampled in this study area include:

|              |                  |
|--------------|------------------|
| Mill Creek   | (WSC 400-362300) |
| Sedan Creek  | (WSC 400-351000) |
| Quill Creek  | (WSC 400-313700) |
| Wilson Creek | (WSC 400-339200) |
| Insect Creek | (WSC 400-324400) |
| Lorne Creek  | (WSC 400-301700) |

Numerous first to fourth order watersheds, tributary to the Skeena River, are included in this study area yet are not listed above, as most do not have watershed codes yet.

## **2.3 Access**

Road access within the study area is limited. Roads cross many of the tributary streams in the lower reaches yet most of the upper watersheds are pristine. Roads currently extend as far south as Quill Creek (access to two thirds of the study area) and are planned to continue further south during the 2000 season. By July 2000 a bridge will be constructed over Quill Creek. Spur roads extending 3 to 4 kilometers up the Quill and Hammersley drainages are planned for the 2000 season. As there are few roads in the high elevation areas of the study area, inventory crews will be accessing these areas by helicopter. However, the upper Mill drainage can be accessed through the Mill Lake Road. This road parallels upper Mill Creek along and around the Mill Lakes.

## **3.0 BACKGROUND REVIEW**

An extensive background review was completed for the project area. Data sources reviewed include:

- consultant reports;
- SCI planning and stream class information;
- previous inventory data;
- FISS data base and maps and
- DFO/MELP Fish Habitat Inventory and Information Program (FHIIP or SISS) catalogue for Sub-district 4C Hazelton.

A complete list of references and contacts used during the background review is provided in Appendix I. The background review indicated that the following species are present within the study area:

- coho salmon (*Oncorhynchus kisutch*);
- pink salmon (*O. gorbuscha*);
- chinook salmon (*O. tshawytscha*);
- chum salmon (*O. keta*);
- steelhead/rainbow trout (*O. mykiss*);
- Dolly Varden char/Bull Trout (*Salvelinus malma*);

Prior sampling, fish presence and historical features have been added to the planning maps and the FDIS database. These sites will be used to modify the sampling plan and avoid redundancy in sampling efforts.

## **4.0 PROJECT PLAN**

### **4.1 Phase 4: Field Data Collection (Streams)**

Following is an outline of our approach to the field work, clarification of specific sampling methodologies, and an estimate of the effort required. The following sections describe the methodologies and approaches to complete field sampling, data collection and reporting.

#### 4.1.1 Pre-Field Preparation

Pre-field preparations will entail both office activities and logistics planning in co-ordination with members of the project team, the Implementation Contractor and Skeena Cellulose Inc. Fish collection permits have been obtained from the Ministry of Environment, Lands and Parks (MELP) and the Department of Fisheries and Oceans (DFO).

Pre-field preparations will include a crew talk and pre-field training. During the crew talk, safety issues and procedures will be reviewed. All staff will be required to complete pre-field training to review the standards and procedures. Crew members who are not involved in the planning phases will be informed about project specific logistics and requirements. The crew talk and pre-field training will provide a means to ensure that all inventory cards are completed in a standardized manner by all crews and that crews are aware of QA/QC requirements.

#### 4.1.2 Equipment

Triton possesses the majority of field equipment necessary to complete the project. Rental vehicles (4X4 trucks) and hand held radios would be secured prior to the commencement of Phase 4 (Field work).

Each crew will be equipped with a Smith-Root Model 12B backpack electrofisher and other standard field gear (Abney level, hip chain, tape measure, VHF radio, first aid kit, etc.).

#### 4.1.3 Field Assessment

Two person field crews will conduct field work. Crew mobilization will take place using a variety of methods depending on the access available in each watershed. In watersheds where road access is available, crews will drive to the sample sites. In watersheds where road access is unavailable, crews will be transported by helicopter (Bell Jet Ranger) to the sample sites.

Field crews will be supplied with forest cover maps, TRIM planning maps and aerial photographs to assist in locating and accessing reaches of interest (on the ground). Reaches will be largely accessed using compass bearings, hip chains and GPS units. Red and white striped "creek" flagging tape labeled with TECL (Triton Environmental Consultants Ltd.) will be used to mark the surveyed section of stream.

All streams will be surveyed with the intent that the information gathered would be used in developing Local Area Agreements for the study area. In some watersheds it will be advantageous to, rather than pursue Local Area Agreement survey criteria, cover adequate sampling to achieve classifications as described in the Forest Practices Code - Fish stream Identification Guidebook (MoF, 1998). In such cases sample design and logistics will be evaluated in determining the best sampling strategy, in an effort to provide the best product to the client and the province.

#### 4.1.4 Fish Species Sampling

Fish sampling efforts will focus on reaches of <20% gradient (>20% at the FRBC Co-ordinator, Regional Inventory Specialist and Project Manager's discretion (i.e. suspected bull trout, regionally significant species presence)) and will follow the procedures outlined in the *Reconnaissance Fish and Fish Habitat Inventory: Standards and Procedures* (May, 1998) and the *Forest Practice Code's* Fish Stream Identification Guidebook. A minimum 100 m of stream length or a length equal to 10 bankfull widths (whichever is greater) will be sampled in each reach identified for sampling. In addition, intermittent fish sampling may be conducted during travel between sample sites (in an upstream direction), upstream and downstream of barriers and within habitat features (pools, debris jams etc.) that may be utilized by fish.

The presence, relative abundance and diversity of fish species will generally be evaluated through electroshocking at least 100 linear meters of stream length. In areas where return visits are practical, minnow traps baited with salmon roe will be set and allowed to remain for a 24 hour period. This sampling method will be used to supplement electroshocking data, or in areas that are not suited to electroshocking (deep pools, wetlands, and active spawning areas). Other sampling methods, such as snorkeling,

beach seining, and angling may be used where necessary, or where requested by the Project Monitor.

All fish sampling data will be recorded on Fish Collection Forms. The following data and samples will be recorded and collected for fish caught at each sample site:

- species (keyed out using RIC's Field Key to Freshwater Fishes of BC). Special attention will be given to documenting species at risk in Region 6.
- length to the nearest mm (fork length or total length depending on species) determined for 30 random samples of each fish species captured including the longest and shortest fish;
- life stage;
- a representative sample of any abnormal or unidentified fish or a species of fish out of its normal range will be preserved and submitted to the Implementation Contractor as well as all non-game fish captured from each 2nd - 4th order watershed.

For all reaches with non-fish bearing classification a written explanation supporting the classification will be submitted (Non-Fish Bearing Classification Report) in the final report. The explanation will focus on sampling methods utilized during the field program, and water quality parameters, including conductivity and turbidity.

The fish bearing status of streams may be directly supported by sampling data or indirectly inferred based on fish captures in associated reaches, or habitat quality and the occurrence or lack of barriers to fish passage. Should a barrier be located, sampling will focus on covering perennial and non-perennial habitat types above that barrier. Sampling in perennial habitats will follow the Guidelines for Local Area Agreement (LAA) Preparation-Skeena Region (version 2) or the Forest Practices Code - Fish stream Identification Guidebook (MoF, 1998), whichever is best suited to the drainage. This will include sampling perennial habitats above barriers with adequate intensities: stream order  $u/s$  of barrier  $\times 2$  = number of required sites (for the LAA guidelines) and possibly less to satisfy Forest Practices Code standards. Both systems will provide sampling intensities that should allow field crews to cover all spawning, rearing and overwintering habitat types within that particular stream. Minnow traps (10) or a gill net will be set overnight in possible overwintering wetlands and lakes. Where practical, primary or secondary lakes sampling methods will be conducted.

Identification of barriers in the field is critical to describing and assessing fisheries distribution within a particular watershed or stream. Field crews will try to identify these barriers while on site, by either using a helicopter reconnaissance of the stream or by strategically moving sample sites while still in the field. Field crews understand the importance of locating and finding barriers to adequately address distribution. If the proposed plan needs modifications or altering, the project manager will be in contact with Paul Giroux. At the end of each field day crews will meet to discuss data and color code

interpretive maps. This color coding of maps will allow field crews to identify unanswered questions regarding distribution and make proper changes while still in the field.

#### 4.1.5 Habitat (Site) Description

A reach description will be completed for each reach (at fish sampling sites), consistent with the Site Description form and entered into MELP's MS Access database as part of Phase 5. Each sampling site length will be 100 m. or >10 bankfull widths whichever is greater. The following data will be collected at each site:

- reach length
- site length
- stream gradient
- 6 individual channel width measurements
- estimates of bed material size
- measurements of stream cover / riparian vegetation and large organic debris
- channel confinement
- water temperature
- conductivity (ambient)
- flow (see 4.1.6 Water Quality)
- major features (fish passage barriers, log jams, LWD, beaver dams, clay slides, etc.)
- obvious fish habitat limitations or restoration opportunities
- preliminary identification of obvious Fisheries Sensitive Zones as *per Fish-stream Identification Guidebook* specifications.

#### 4.1.6 Water Quality

Consistent with the terms outlined in Schedule A, Triton will sample water quality parameters in the field at each sample site. Parameters will be measured in the field in order to reduce laboratory costs and shipping and receiving requirements. Specifically, Triton proposes to measure air and water temperature using standard field thermometers, pH and conductivity using hand held meters, and turbidity using visual estimates. Water quality measurements will be taken in each sampled reach as specified in the RFP.

#### 4.1.7 Wildlife Observations

Wildlife observations will be noted and specific details recorded. Amphibians, aquatic invertebrates and macrophytes will be described and identified to Order or Family (where practical). Photographs will be taken for further documentation and confirmation. Wildlife observations will be recorded on the Site Card with emphasis placed on species considered rare, endangered or threatened as defined by the Conservation Data Centre.

#### 4.1.7 Photographic Documentation

Photographs will be taken, recorded and presented as per the *RIC Guide to Photodocumentation* (March, 1996). Photographs will be taken of each sample site (including downstream and upstream perspectives), of each feature identified and of representative or unidentifiable fish species. Photographs will be documented on Site Cards and Fish Collection Forms.

#### 4.1.8 Inventory Area Specific Sampling

Through completion of Phases 1-3 we have identified specific reaches within the Study Area to be sampled. Sample sizes are outlined in Table 1.

Table 1. Sample Site Summary.

| <b>Inventory Area</b> | <b>Total No. of Reaches</b> | <b>Number of Reaches to be Sampled</b> |
|-----------------------|-----------------------------|----------------------------------------|
| Kitwanga              | 1688                        | 118                                    |

The criteria for sample site selection was discussed with MELP's Fisheries Inventory Specialist, Mr. Paul Giroux. In order to achieve Reconnaissance (1:20,000) Fish and Fish Habitat Inventory objectives sites were selected using the following criteria:

- where it is necessary to determine fish presence within a sub-basin;
- to address Local Area Agreements and fisheries distribution within the project area;
- inlets and outlets of lakes where it is necessary to determine fish presence within a sub-basin;
- lower order reaches that are likely to delineate the upper limits of fish distribution;
- within or adjacent to proposed cutblocks;
- above and below potential barriers, and around the 20% gradient break; and
- SCI's operational needs.

#### 4.1.9 Lakes Sampling

Lakes have not been specifically selected for sampling. After discussions with Paul Giroux (Regional Fisheries Inventory Specialist) and SCI, lakes to be sampled will be selected after the conclusion of the stream sampling program. It is suspected that no lake sampling will be required as the lakes within the area are either known to contain fish or are high within the watershed in alpine and sub-alpine zones and are unlikely to contain fish.

Should lake sampling be required the following plan will be used.

## **4.2 Lakes Plan**

### 4.2.1 Phase 4: Field Data Collection

Following is an outline of our approach to the field work, clarification of specific sampling methodologies, and an estimate of the effort required. The following sections describe the methodologies and approaches to complete field sampling, data collection and reporting for primary and secondary lake inventories in the Study Area.

### 4.2.2 Pre-Field Preparation

Pre-field preparations will entail both office activities and logistics planning in coordination with members of the project team, the Implementation Contractor and Skeena Cellulose Inc. Fish collection permits have been obtained from MELP and DFO as part of pre-field planning.

### 4.2.3 Equipment

Triton possesses most of the field equipment necessary to complete a lakes project. A rental vehicle (4X4 truck) and programmable VHF hand held radios will be secured prior to the commencement of Phase 4 (Field work). Additional lakes sampling equipment is owned by Triton including, Zodiacs and outboard motors, Van Dorn bottles and depth sounders. A number of electroshockers and cameras, standard stream sampling tools, are also owned by Triton.

### 4.2.4 Field Assessment

Field work for lakes will be conducted by a 2 person field crew. Crew mobilization will take place using a variety of methods, which will maximize the efficiency of the field program depending on specific access available at each lake. For lakes with road access, the field crew will utilize a 4X4 pickup truck. For sites in which road access is unavailable the field crew will be mobilized by helicopter (Bell Jet Ranger) from Quantum Helicopters in Terrace.

The field crew will be equipped with a Smith-Root Model 12B backpack electrofisher, gill nets, minnow traps and other standard field gear (zodiac and motor, clinometer, hip chain, tape measure, Van Dorn bottle, VHF radio, first aid kit, etc.). Utilizing a combination of these methodologies will ensure that field efficiency is maximized and the project target of sampling primary lakes in 2 days and secondary lakes over 1 day is attained.

### 4.2.5 Fish Species Sampling: Primary Lakes

Multi-panel floating and sinking gill nets will be the principal fish sampling method utilized in primary lakes, along with minnow traps and angling. Gill nets (floating and sinking) to be used will follow specifications for standard nets used in reconnaissance level lake inventories in BC. Gill nets will be set with the smallest mesh size at the shallow end of the net set and secured to a point on shore. Gill nets and minnow traps will be allowed to fish overnight for a minimum period of 8 hours. Gill nets will be set in the evening and monitored for approximately 30 - 45 minutes for an indication of catch success. Professional judgment will be applied to reduce the netting effort if early indications of net catch suggest excessive fish mortality will result from a standard two net or overnight set. The depth sounder will be operated while setting gill nets to provide a record of bottom substrates and the presence of submerged logs or snags.

Baited (boraxed salmon roe) minnow traps will be set around the perimeter of the lake within shallow shoal areas. Water depths at trap sites will be between 0.3 m and 1.5 m and the trap entrances will be placed parallel to shore or submerged cover. Styrofoam floats will be attached to the traps with a 1.5 m length of string. Minnow traps will be allowed to fish overnight for a minimum of 8 hours.

Inlet and outlet streams will be sampled using an electroshocker to determine fish species presence and relative abundance.

#### 4.2.6 Fish Species Sampling: Secondary Lakes

Secondary lakes are intended to be 1 day surveys of fish species presence or absence. Gill nets will be set initially upon arrival to a lake and allowed to fish while the field crew completes their limnological sampling and other tasks. Minnow traps will also be set for the day during secondary lake surveys. Fish sampling in streams will not be conducted for secondary lakes unless downstream or upstream reaches are sampled during the concurrent stream inventory.

#### 4.2.7 Fish Species Sampling: General

All fish sampling data will be recorded on waterproof Fish Collection Forms. The following data and samples will be recorded and collected for fish caught at each sampling site:

- species (keyed out using RIC's Field Key to Freshwater Fishes of BC). Special attention will be given to documenting species at risk;
- life stage;
- wet weight (in grams);
- a representative sample of any abnormal or unidentified fish or a species of fish out of its normal range (geographic) will be preserved and submitted to the Implementation Contractor.

Non lethal aging structures will be removed from a sub-sample of fish captured in lakes (generally 30 of each species) to determine the age of cohorts present in the lake. Fish killed in gill nets will have otoliths removed for aging. Aquatic insects, invertebrates and amphibians will be identified, enumerated and released. Unidentified invertebrates will be retained and preserved in buffered 10% formalin.

A reach description will be completed for one reach of the major inlet and outlet streams to each primary lake consistent with the Site Description form and entered into MELP's MS Access database as part of Phase 5. Each sampling site length will be 100 m. or >10 bankfull widths whichever is greater. The following data will be collected at each site:

- reach length
- site length
- stream gradient
- 6 individual channel and wetted width measurements
- estimates of the percentage areas of the different habitat units
- estimates of bed material size, by size class
- compaction of bed materials
- measurements of stream cover / riparian vegetation and large organic debris
- measurements of bank instability
- channel confinement
- percentage of stream bars
- air temperature
- water temperature
- conductivity (ambient)
- discharge
- major features (fish passage barriers, log jams, LWD, beaver dams, clay slides, etc.)
- obvious fish habitat limitations or restoration opportunities
- preliminary identification of obvious Fisheries Sensitive Zones as per Fish-stream Identification Guidebook specifications.

For secondary lakes a visual survey of each inlet and outlet will be conducted to determine the presence of potential habitats that are important to fish.

For all inlet and outlet reaches with non-fish bearing classification a written explanation supporting the classification will be submitted. The written explanation will be included in the final report. The discussion will focus on sampling methods utilized during the field program, water quality parameters including conductivity and turbidity and recommendations for follow-up sampling.

#### 4.2.8 Lake Habitat Descriptions

Bathymetric soundings will be conducted using a Lowrance X-16 electronic depth sounder. The transducer will be mounted on the transom of a 3 m Bombard inflatable boat powered by a short-leg 9.9 hp Johnson outboard.

An E-line transect will be performed along the main (long) axis of the lake to determine the maximum depth in the main basin of the lake. Upon completion of the e-line transect, a shoreline perimeter cruise will be conducted to record lakeshore feature, surrounding terrain, vegetation and aquatic plant descriptions.

Full bathymetric surveys will only be required on primary lakes. The transects will be conducted in a straight line, perpendicular to the shoreline and towards an easily identifiable feature on the opposite shoreline (i.e. point, snag etc.). A constant speed will be maintained for the duration of each transect (1 m/sec). Locational cross-reference points during the transect will be taken as bays, islands and peninsulas are passed. Echograms will be marked with a single solid line to represent the start of each transect and double solid lines to indicate end points. Measurement of lake surface area and drainage area will be determined using a Placom KP-90N digital planimeter.

#### 4.2.9 Water Quality

Triton field crews will sample water quality parameters in the field at each limnology station. EMS numbers will be acquired from MELP prior to the commencement of the field component in primary lakes. Parameters will be measured in the field in order to reduce laboratory costs and shipping and receiving requirements. On primary lakes, water samples will be sent, as required, to a certified laboratory for analysis. Parameters analyzed will follow the Lake and Stream Inventory manual and will be discussed on a case by case basis with the regional Fisheries Inventory Specialist.

Specifically, Triton proposes to measure field air and water temperature using standard field thermometers, pH and conductivity using hand held meters, and turbidity using visual estimates.

Lake limnological sampling will also include a dissolved oxygen/temperature profile, to be completed with a YSI DO probe and a Secchi depth measurement to be taken at the deepest point within the lake. Conductivity and pH will be measured from just below the surface and above the lake bottom. Lake water samples will be collected with a Van Dorn bottle.

#### 4.2.10 Wildlife Observations

Wildlife observations will be noted and specific details recorded. Amphibians will be identified in the field. Abundant invertebrates will be described and field identified to Order or Family (where practical), as will aquatic macrophytes. Photographs will be taken for further documentation and confirmation. Wildlife observations will be recorded on the lake survey form with emphasis placed on species considered rare, endangered or threatened as defined by the Conservation Data Center.

#### 4.2.11 Photographic Documentation

Triton will make extensive use of photography throughout the project. For lakes, a series of lake panorama pictures will be taken from the geographic center of the lake. Pictures will also be taken which highlight geographic features, surrounding country and aquatic vegetation. Other photographs taken on lakes will include evidence of recreational use, wildlife features and fish species (if captured).

Photographs will be documented on Lake Survey forms and Triton's photodocumentation form and presented in the report in a manner that meets RIC standards.

### **5.0 PHASE 5 DATA MANAGEMENT; WATERSHED AND LAKE INVENTORIES**

The office portion of Phase 5 will entail entering hardcopy field notes and field forms into requisite electronic database forms including lake forms, site cards, fish collection forms and Photodocumentation Form 1. ILP's, submitted during the initial phases will be converted to watershed codes and NID's will be converted to UTM coordinates for mapping and geo-referencing purposes. Photographs taken during the field season will be developed and captioned and coupled with Lake Forms/Site Cards where applicable. Additional photographs will be indexed in referenced binders with Photodocumentation Cards and negatives. Bathymetric and lake outline mapping will be completed during Phase 5.

### **6.0 PHASE 6 REPORTING AND MAPPING; WATERSHED AND LAKE INVENTORIES**

The final report will follow the outline provided in the Reconnaissance (1:20,000) Inventory Standards and will include data analyses, fisheries values, stream and riparian classifications and management recommendations. This report will contain fish bearing and non fish bearing classification reports and a table supporting each will include sampling methods, (and effort) habitat conditions, barriers to fish passage and water quality parameters.

For all reaches with non-fish bearing classifications a written explanation supporting the classification will be submitted (Non-Fish Bearing Classification Report). The written explanation will be included in the reach descriptions provided in the final report. The discussion will focus on sampling methods utilized during the field program, water quality parameters including conductivity, turbidity and recommendations.

All final map work will be produced using a GIS software program. Maps produced digitally will include all information as per the requirements outlined in the

Reconnaissance (1:20,000) Inventory Standards. The June 7, 2000 correspondence between Paul Giroux and Triton indicates that 1 (one) mapping product is required rather than a project and an interpretive map product. These maps will be maintained as close as possible to that of the RIC Standard Fisheries Inventory Interpretive map. The reach summary symbol that currently points to sample sites will be replaced with the site data symbol from the Project Maps. Lake summary symbols will be used where appropriate. It will also include: watershed codes (ILP's); stream names; waterbody identifiers; reach breaks; fish sampling sites; fish species; features; stream classification; annotated fish distribution and historical data. Overview maps will accompany the final reports and will show sampling site locations.

## **6.1 Existing Data**

Existing RIC inventory data will be incorporated into the report where applicable and for ease of reference. These results will be used to establish fish presence and distribution throughout the watershed and to facilitate and/or confirm stream Riparian Management Area classifications.

Historical inventory data will be shaded gray on the interpretive maps and will be linked via a unique site number to the original report.

## **7.0 PROJECT TIMELINES**

|                                                 |                   |
|-------------------------------------------------|-------------------|
| Completion of Phase I to III Activities         | July 15, 2000     |
| Completion of Phase IV Activities               | August 31, 2000   |
| Completion of Phase IV Deliverables             | November 30, 2000 |
| Completion of Draft Phase V and VI Deliverables | March 15, 2001    |

## **8.0 PROPOSED STAFF**

|                      |                |
|----------------------|----------------|
| Project Director     | Dave Gordon    |
| Project Manager      | Jason Harris   |
| Fisheries Biologist  | Bryan Williams |
| Fisheries Technician | Eamon Miyagi   |

| Fisheries Biologist  | Eva Wichman    |
| GIS Coordinator      | Dave Warburton |
| GIS Technician       | Ed Lem         |

## 9.0 EQUIPMENT LIST

### Fish Collection/Crew

|                                        |
|----------------------------------------|
| 1 electrofisher                        |
| 1 large battery                        |
| 1 small battery                        |
| 1 charger                              |
| 2 anode poles                          |
| 2 cathodes                             |
| 3 pairs of linesman gloves             |
| Fish Collection Permit                 |
| 1 small net                            |
| measuring board                        |
| recovery bucket                        |
| 10 minnow traps                        |
| bait                                   |
| 4 bottle of alcohol                    |
| voucher jars                           |
| Fish Collection Methods and Procedures |
| 1 bottle of clove oil                  |
| scale envelopes                        |
| DNA vials                              |
| razorblade knife                       |
| ziplock bags                           |
| fishing license                        |

### Field Gear/Crew

|                      |  |                   |  |               |                    |

| 1 flashlight            |

## **10.0 CONTINGENCY PLAN**

It is critical that sampling be approached strategically, rather than (or in addition to) site based. In cases where sampling could not be conducted, or where conditions for sampling were unfavorable, field crews will utilize strategic selection and professional judgement to relocate sites within the watershed. This will allow maximum sampling efficiency and allow crews to assess barriers and fisheries values throughout the watershed. Triton has proposed that all sample sites (non strategic) upstream of confirmed non-fish bearing sections or that will not provide additional fisheries information be relocated in the field. This number may prove to be in excess of 60% of the random sample sites.

**APPENDIX I**

**Project Phase Completion Report**

**(with associated deliverables)**

**Phase I to III Pre-field Project Planning Report - 1:20 000 Fish and Fish Habitat Inventory  
of the Sub-basins between and including Lorne and Mill Creeks on the North Side of the  
Skeena River within the Kispiox Forest District**

- **FRBC Project Number:** SCI\_C172\_010\_2001
- **FDIS Project Code:** 3476

| July 10-15, 2000 | Contact list                     | 5 h        |
| July 10-15, 2000 | Stream/wetland/lakes tables      | 4 h        |
| July 10-15, 2000 | Compile digital products         | 2 h        |
| July 10-15, 2000 | Compile report                   | 4 h        |

### Summary of Work Completed

A meeting was conducted with Todd Mahon (contract monitor) to obtain information regarding the project specifications and project area.

A background data review was conducted to establish existing information within the working area. These reports were obtained from the Ministry of Environment Land and Parks (MELP) office in Smithers, the SCI office in Carnaby and the BC Conservation Data Centre. A bibliography and contact list was completed (attached).

FISS maps were reviewed and compared with the data collected during the background review. Information that was not included on the FISS maps, as well as new information gathered in Phase 4, will be transcribed to a corresponding 1:50,000 scale National Topographic Scale (NTS) map at Phase 5.

The project area boundaries were delineated on TRIM maps and all streams, wetlands and lakes were assigned, waterbody identifiers or ILP's. Watershed codes and ILP's were assigned using Arcview and FDIS. Detailed map and air photo analysis was conducted in order to identify and classify sub-basins within the study area, to determine reach breaks and to determine individual reach characteristics for all watercourses, lakes and wetlands. The delineation of sub-basins was based on stream order and hierarchy within the watershed.

All watercourses within the study area were divided into reaches and physical features affecting fish habitat suitability (including gradient, confinement, channel pattern and riparian vegetation) were identified.

- Planning for the field sampling portion of this project followed a balanced approach between MELP requirements and SCI's operational needs. Initial sample site selection was undertaken utilizing the FDIS random generator. Further discretionary sites were added to the initial randomly generated sampling sites.

Revisions to the stream sampling plan (alternate site locations) will be revised during Phase 4, which is scheduled to commence on July 24, 2000.

### **Progress and Problems Summary**

Due to the steep morphology of the study area, it is anticipated that barriers to fish may exist low in each watershed, close to the mainstem Skeena River. If this is the case, sample sites, most of which are placed randomly high in the watershed, will be completed in non-fish bearing streams. This is necessary to a point, however, completing order x 3 and 4 sample sites upstream of a barrier is not necessary and a waste of valuable helicopter and crew time. We anticipate several changes to the sampling plan, and as discussed with Paul Giroux and SCI these changes will significantly alter the original sample site selection. Detailed reach planning forms will be completed during Phase 5 and will be submitted as a deliverable for this phase.

No lakes were selected for sampling. Due to the steep nature of the terrain, lakes are not common throughout the study area. The existing lakes are either located in the alpine or in the lower valleys within fish bearing sections of the watersheds. It is anticipated that lake surveys would not play a large roll in determining fish presence throughout the study area.

### **Next Phase Project Plans and Constraints**

FISS updates will be provided with Phase V.

Phase IV (field) is scheduled to commence July 24, 2000

### **Summary of Phase 1-3 Costs**

|                   |             |
|-------------------|-------------|
| Professional Fees | \$24,056.00 |
| Disbursements     | \$1,084.00  |

Costs as per original budget

**Contract Monitor Acceptance**

|                                     |                     |
|-------------------------------------|---------------------|
